Direct your questions and support issues to SUPPORT@MASTERSBALL.COM

We encourage you to read at the least the first 5 chapters, from Installation to Basic Flow and especially recommend a careful look at ROTO Stats chapter.

We suggest that you practice draft by creating a mock league. This mock league can be deleted any time. If you decide to create a mock league, practice drafting players to teams, undrafting them, moving them from one roster spot to another spot and, if auction draft, modifying \$ values. Become familiar with the Views and, if your league uses standard 5X5 scoring, with the Roto 5X5 Stats window.

Overview of Mastersball Draft Software: with MastersDraft, you will be able to track rosters and standings in real time, as well as monitor your progress in each scoring category. You can use our projections and rankings for common leagues or customize our projections to your league specifications. You can even use your own projections and rankings. The application can handle drafts or auctions, including keeper formats. You can customize your roster configuration including reserve spots. Future releases will feature upgrades, some of which are already planned, but we will also be more than happy to incorporate user input.

Most recent Mastersball player projections are pre-imported. You only need to import CVRC created values if you use them instead of the Mastersball projections. Check “How to import” section for instructions.

Installation

MastersDraft supports Windows platform (XP, Vista and 7). The minimum recommended screen resolution is 1280 X 800. Download the file MastersDraft.zip from www.mastersball.com. The file that is downloadable from the Mastersball website is zipped. Start by creating a folder and then place the file in that folder. Although the Draft Software application files could reside anywhere on the computer, we recommend that you create the folder under ...\\Program Files. Give it a name that will help you remember where you placed the application. We recommend that you call it MastersDraft. You will need to remember that for future upgrades. All future software upgrades should be placed in this one folder.

To unzip a file, highlight it with the left mouse and click on it with the right mouse. Then left click on Extract. The zipped file contains a folder named MastersDraft. In the folder you will find the actual executable called MastersDraft.exe, a library folder named MastersDraft Libs, a database folder called My Baseball and the User's Manual.

The projections are built in and are in a file called Players.zen under My Baseball folder.

Warning: at all times keep the executable MastersDraft.exe and the MastersDraft Libs folder libraries in the same folder.

To start the application, open Windows Explore, navigate to where you have placed the files and double click on the executable. Mastersball Draft Software will open. You are ready to go. Warning: First thing, before you do anything else, create a new league. The act of opening MastersDraft will create two new database files called Config.zen and Leagues.zen under My Baseball folder.

This picture depicts the folder structure (folders are in red fonts):

```
.....Program Files\\MastersDraft\\Mastersdraft.exe
                                \\MastersDraft Users Guide.doc
                                \\MastersDraft Libs\\Appearance Pack.dll
                                \\RealSQLdatabase.dll
                                \\My Baseball\\Players.zen
                                \\Leagues.zen
                                \\Config.zen
```

You could create a shortcut and place the executable on your desktop. Highlight MastersDraft.exe with the left mouse, click with the right mouse and left click on Create Shortcut. Once shortcut appears in the folder, drag it to the desktop. Once the shortcut is available, you can start the app by clicking on it.

When new versions of the applications become available from Mastersball.com, simply replace the old version with the new one. Basically, delete the User's Guide, MastersDraft.exe, MastersDraft Libs folder and Players.zen under My Baseball folder. Do not touch Leagues.zen and Config.zen as these two files contain your league database.

As a matter of fact, we strongly recommend that from time to time you back up Leagues.zen and Config.zen to a USB drive or whatever is your back up device. If you have customized the projections then back up Players.zen. Anything else can be downloaded from Mastersball.com anytime.

Why would you need to download a new version and what can go wrong? Unless a software upgrade is being released and the web site will notify you of it, there is no need to download new versions of the application. You can import and continue to import new projections as they are released by mastersball.com. If you download a new version and after bringing it up you do not see the league you have created with the earlier version then you have placed the new version in a folder different than the old folder. That's OK. Copy and replace Leagues.zen and Config.zen files from the old My Baseball folder. You will find your league when you re-open the app.

Windows 7 Operating system Security Woes

There are a couple of issues with Windows 7 with which users of previous operating systems may not be familiar. One is security and the other is font size.

The application is developed for the Medium size font. When opening MastersDraft windows, fonts may appear too large. In this case change the font size, here is how:

To change font size: Left click on Start (Microsoft globe in the lower left corner) and then on Control Panel. Then click on Appearance and Personalization. Click on Display. Choose Medium and then click on Apply. You will be told that the change requires logging off. Follow instructions to log off then log back on.

The new security features introduced by Microsoft in their newest Windows 7 operating system have compelled us to put together these instructions. Users who are familiar with the prior

operating systems such as Vista or XP may find Windows 7 mindboggling. A typical problem is an error message saying that the database is read-only when attempting to save a new league. To ease the pain of transition to Windows 7, listed here are a few key suggestions:

- Do not download Mastersdraft zip file straight into Program Files folder. Do not download into any folder whose name ends in (86). These folders are meant for 64bit applications. Although Mastersdraft is fully compatible with a 64bit system, we do not recommend using a 64bit folder
- We recommend that you create a new folder, say, mastersdraft under C> Program Files. Download and expand Mastersdraft zip file into it. That is your personal area.
- Make sure that you have Full Control permission rights to this new folder. To verify or change permission rights, right mouse click on mastersdraft folder name and left click on Properties. Open Security tab. Your name should be listed under “Group or user names” (upper pane) and you should have Full Control (lower pane). If not, click on Advanced and then Owner tab, then Edit and then click on button Other Users and Groups. On this new window click on Advanced and on the next window (seventh new window by my count, who said this was easy) make sure first that Object Types (see upper right) is Users, Groups or Built-in Security Principals. Click on Find Now, find yourself in the lower pane, highlight the name and click on OK. Then OK again to go back to the Security tab. Highlight your name and in the lower pane titled Permissions, check Full Control. Click on Apply and you are done. This is how you add ownership to folders, something that is good to know with Windows 7.

User Interface Convention

Welcome to Mastersball Draft Software. The software uses the convention of presenting a new window for each separate function or information. Users move from one window to the next by clicking on the button marked Next.

The Main window with the key menu function stays permanently displayed. Users can move from function to function via the top menu items. This allows multiple windows to be open at the same time. Main window is shown on the cover page of this manual.

TAB key: use of TAB key to move from one field to the next on a window is encouraged. For example, the first window will you use is probably going to be the Create League Wizard's window to enter the league name. After entering the name, press TAB key to move the cursor to the button Next and then press Enter key to close the window and open the next in the sequence.

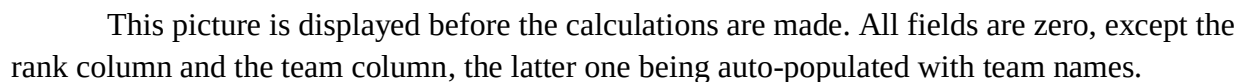

Other windows work in a similar manner. For example, when entering team names, tab to Add button - one key press -, press Enter - once - and continue with typing in the next team name.

Editing: in-line editing, that is, editing a name or changing a number displayed in a list is done by a) highlighting the row, b) double-clicking on the item to edit, c) moving the cursor to one or the other end of the word to change, d) using the Delete or Backspace key to remove unneeded characters and e) typing in the new characters.

Draft: in Auction to draft a player, highlight player's name and click on the roster spot where to drop him, basically two clicks. In between the two clicks you can change the \$ value. In case of Snake or Straight drafts the player is placed in the next slot, so pointing to where to drop the player is not necessary. Note that an "out of order" feature is available. Indicate who to draft by highlighting the player and click on the Draft button.

Apostrophe: Due to the problems that SQL historically had with the apostrophe, all are removed from all the names. For example, Kila Ka'aihue is displayed on the Draft List as Kila Kaaihue. If you have a team with an apostrophe, for example, Bob's Team, you will find it as Bobs Team.

We encourage you to take advantage of the guidance offered by the ROTO Stats window during your draft. ROTO Stats are applicable only if your league is uses standard 5X5 or 4X4 rules. You will find ROTO Stats under top menu View. When first opened, you will see the following picture:

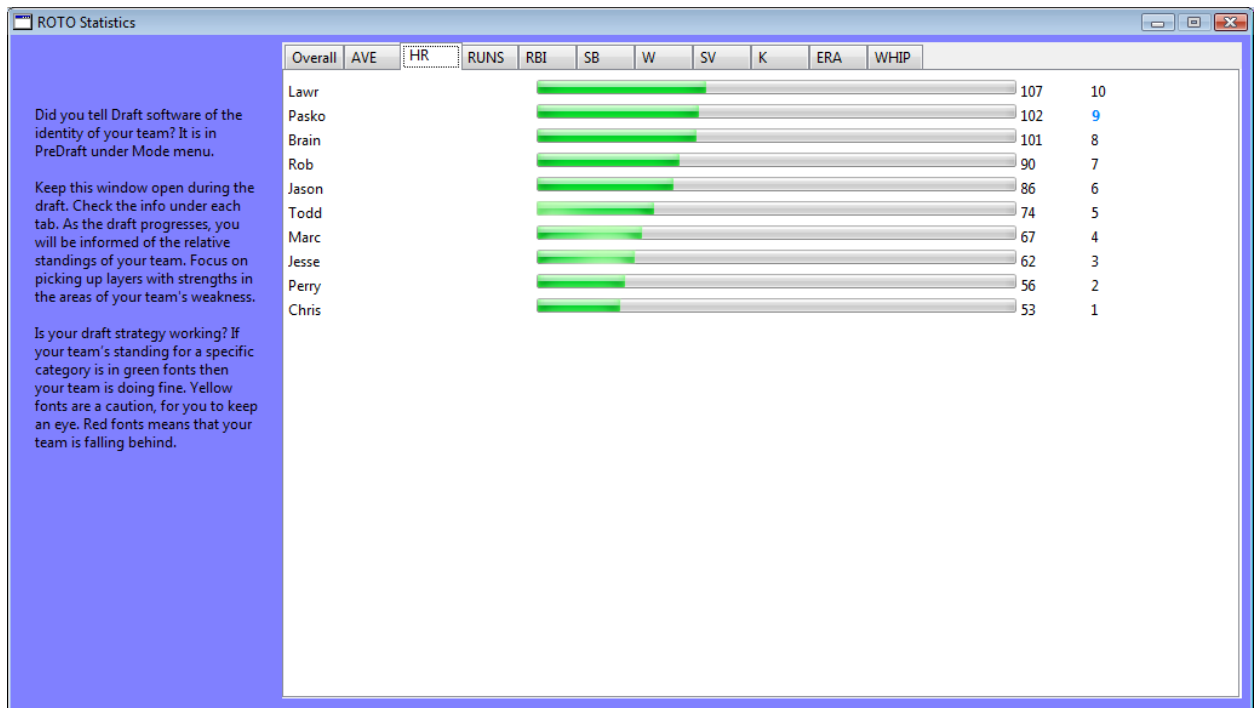

When the draft begins and players are placed on the teams, this window will show the standing for each category using the Roto 5X5 convention, a total for the 5 hitting categories and a total for the 5 pitching categories plus a grand total.

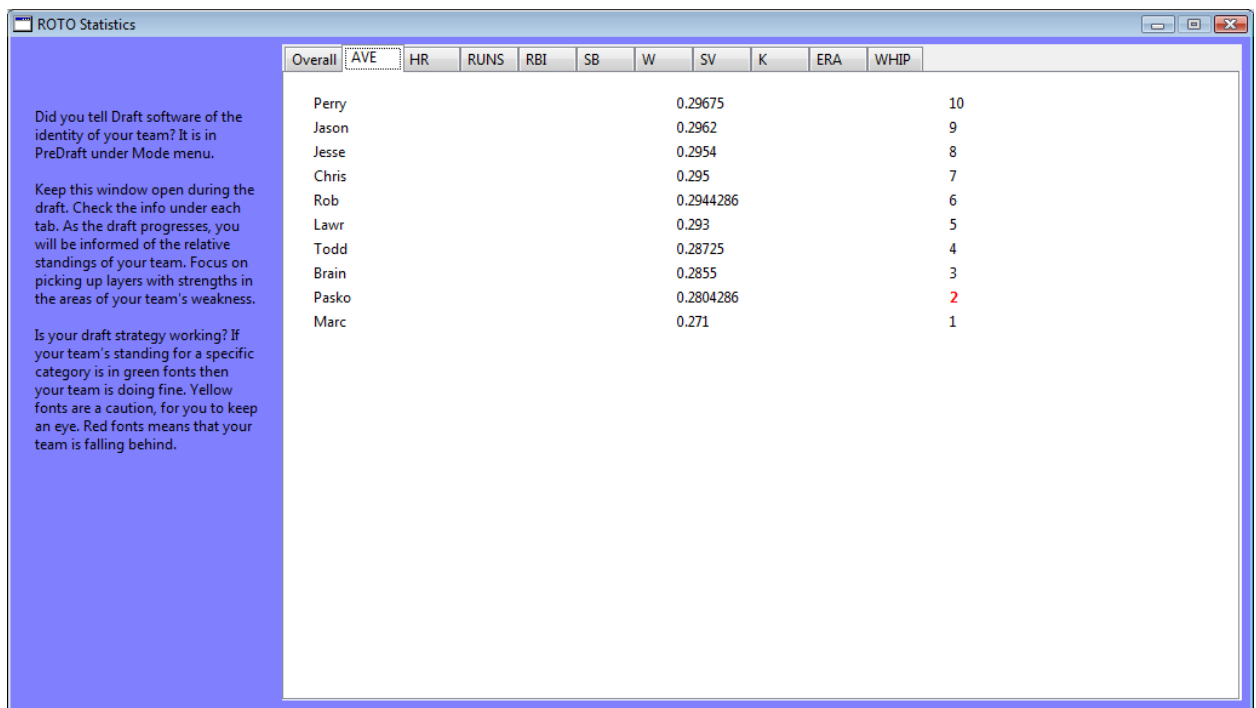

2/28/2013

[illegible]

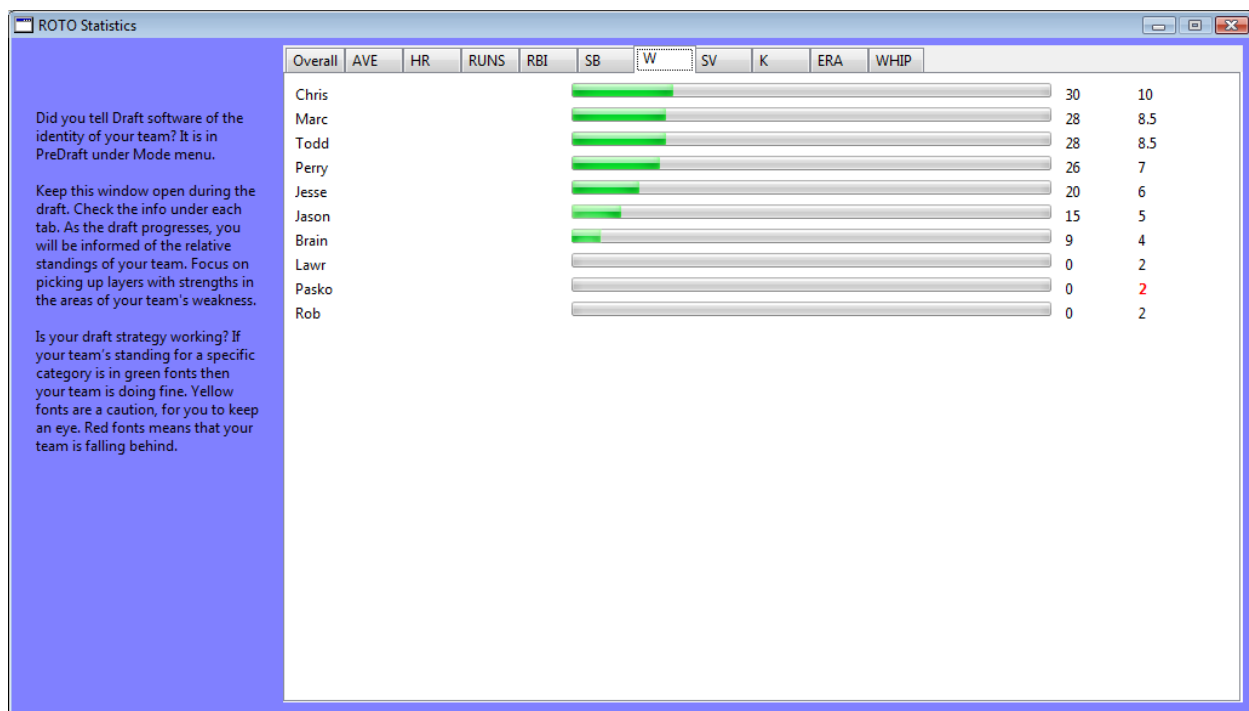

[Pictures shown here do not represent a real draft]

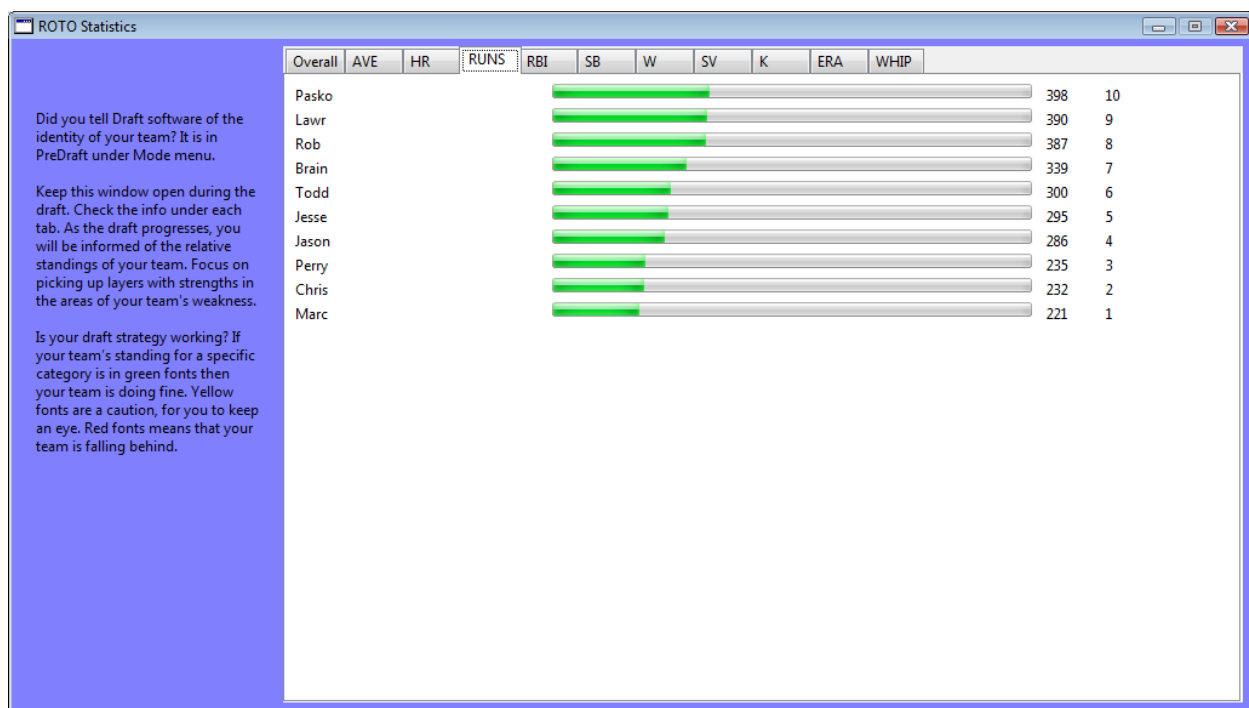

The picture below here shows the Batting Average tab. It is not as impressive as the HR tab, but it provides all the necessary information.

yet. This picture shows the progress of Wins. Clearly three teams have not picked a pitcher

While this picture show the RUNS tab.

Note that the total for my team in the RUNS tab (the team named Pasko) is in black fonts. That is because my team is leading in that category. The same total number for Win and BA is in red while for HR is in blue. (We wanted yellow instead of blue but we found that yellow color does not stand out to our satisfaction). Red font means that your team is way below the leader in that one category while blue means that your team is slightly behind.

The setting of draft strategy, that is, which category you want to dump versus which category you want to do well and be warned if falling behind is done in the Pre-Draft section in the window where you tell MastersDraft the identity of your team.

We encourage you to follow the ROTO Stats window while drafting. You can track your team progress and decide what category or position to target based on where you stand in the different categories in conjunction with the available player pool. But how will you accomplish that? The next chapters of this User's Manual explain the concepts of the MastersDraft application, the flow and provide detail explanation of each window.

Basic Concepts of the Draft Software

This section is a quick gallop through the main concepts behinds the application.

What does MastersDraft provide the user?

The main feature, or objective is to provide a list of available and drafted players and their projected statistics during the draft in conjunction with a visual picture of the progress of the ten ROTO categories as the draft takes place.

As soon as a player is placed on a team, the ten ROTO categories are re-calculated and your team's relative standings is displayed. You will know your team's strengths and weaknesses and you will be able to adjust your draft accordingly.

What do you have to do to get from here to there? You must do the following: a) create a league with its characteristics and teams and b) tell MastersDraft which one is your team.

Which projections are integrated into MastersDraft?

Both our standard and CVRC projections have been integrated into and fully tested with MastersDraft. Projections are built in, however you may want to import the newest projections or modify those obtained from mastersball.com to your liking, if you insist. Note that the spreadsheet format must be left intact.

Does that mean I am married to using Mastersball's projections?

No. We designed MastersDraft to be as flexible as possible. You can easily modify our projections or insert your own instead.

Warning: Make sure not to alter the format and make sure not to have empty slots or columns. Players having empty columns will be rejected. Certain empty columns may cause the program to exit.

The concept of the draft list

Prior to the draft with a click of a button, you should create a draft list. The draft list is created based on the projections and the characteristics of your league. You can choose to base the draft list either on the either the Mastersball projections or player values generate via CVRC, see DraftSoftware tab. If your league has keepers, those are removed from the draft list. All the draft windows show the draft list, player values and player projected Roto statistics. If you base your draft list on the Mastersball projections and rankings for common leagues, the \$ values are selected based on your league, either AL or NL Roto 4X4, 5X5 or 12 or 15 teams mixed.

Pre-Draft

What else besides creating a draft list could a user do prior to the draft?

- a) Mark own team
- b) Enter keepers per team
- c) Trade keepers between teams
- d) Enter notes for each of the players on the draft list

Round versus Roster

You will find that pre and post-draft windows are different depending on the type of draft. If your league uses Auction type of draft, the players are displayed in accordance to the roster positions. For Snake and Straight drafts, the windows use Rounds to display players.

What does a user do select the appropriate type of window? Simply open your league.

Open League

Under File menu, select Open League submenu item and open the league. Opening is the first step before proceeding with other functions. By opening a league, the user has informed MastersDraft about how to proceed.

Drafts

Auction, Snake and Straight: draft list is displayed and continually updated. It can be sorted by player position or by player name as you type. The list can be sorted by Roto categories. In the auction draft, salary and number of players that remain to be drafted are calculated and displayed. Roster is displayed based on your league characteristics. In snake and straight draft

teams are displayed according to the sequence and team order. Draft timer starts/stops with each player drafted. To display a note about a player, if entered before the draft, double click on his name on Players List, the left table of undrafted players.

The software supports up to six active drafts at once, though only one can be open at once. Just exit the draft window and open another league. It is that easy!

Inflation

Auction draft offers automated inflation calculation. What is inflation? Inflation offers a perspective on player value that differs from the standard projected values. A player's inflated value is re-calculated by MastersDraft every time a player is picked by a team. The standard inflation calculators use a rigid ratio between the amount of money available to spend and money that is already spent, either on keepers or on the draft itself. MastersDraft uses a proprietary formula providing higher values at the high end of the player pool and lower values at the low end.

Views

Mastersball projections spreadsheet, CVRC values spreadsheet, DraftSoftware tab and Draft list with player note can be brought up any time.

Teams By Composition view can be displayed during the Auction draft. Teams By Round view can be displayed during the snake or straight draft. Roto stats view is viewable during any type of draft.

Export to Excel

Export to Excel of your draft is possible from the Teams by Composition and Teams by Round views, left pane, that is, from the pane for teams 1 to 12. Auction spreadsheet shows \$ values, while Snake / Straight spreadsheet has rounds. Each has teams across and players down the columns of the spreadsheet.

Post-Draft

Post-draft allows you to empty all the teams or delete individual players from teams.

The basic flow

From starting the app to post-draft

Your league:

Open the New League wizard under File menu item and create you league. You can change any of the league characteristics with the Edit League wizard. Note though that anytime you make changes that may affect the draft list, it is recommended that you re-create the draft list itself.

You can create multiple leagues, each with its own unique characteristics and its own draft list.

Projections and draft list:

MastersDraft relies on existing projections that are built in. New projections can be downloaded from Mastersball. There are two set of projections that could be used: either the standard projections or the player generated values created by the Mastersball proprietary tool CVRC.

Should you choose to use CVRC generated values, it is assumed that you are familiar with the tool. CVRC creates a tab aptly named DraftSoftware specifically for import to this application.

You can import projections anytime and as many times as you wish. Import commands are under Import menu item. Throughout the pre-season you can import projections as often as you want, probably as often as the projections are being modified by Mastersball.com. As soon as you have a new set of projection spreadsheets imported, you must re-create the draft list. You can re-create your draft list any number of times. We want to encourage you to arrive at the draft after having downloaded the newest projections and re-created your draft list. Note that if your league has keepers and you had them set up ahead of time, re-creating the draft list will remove the keepers from the draft list. Your keepers will still be set up as per your earlier input and you will not be presented with a list containing players that already appear on your league's teams.

If you prefer externally-developed projections, they can be used with the draft software IF AND ONLY IF their spreadsheet is formatted PRECISELY as the Mastersball or CVRC input projections. Once prepared, simply import your spreadsheet as you would our projections.

To change the projections, enter by hand into the projection spreadsheets any additional players that you want to have in your league but cannot find on the spreadsheets downloaded from Mastersball. Also, if you have any specific changes to the statistics in the spreadsheets, change them before importing.

Warning: Make sure not to alter the format and make sure not to have empty slots or columns. Players having empty columns will be rejected. Certain empty columns may cause the program to exit.

The draft list is created based on two items: the projections and your league characteristics. For example, if your league is based on American League ML teams only, then the draft list will not contain any National League players. That's why we suggest that you create a league first, before creating the draft list. There will be one draft list per league.

Things to do before the draft:

These commands are under Mode menu item, Pre-Draft submenu:

- 1) You can edit your league, add and/or delete teams
- 2) You can reorder the teams according to the last minute draft pick order
- 3) Tell MastersDraft which of the teams entered in each of your leagues is yours and, should you use Roto scoring, enter your draft strategy
- 4) Keepers may be entered and stored per league / per team
- 5) Keepers may be traded between the teams
- 6) Notes may be entered per player

Draft

Note that the draft itself can be started and stopped any number of times. For example, if you are drafting via email, start the app, open the league and draft any number of players and exit. You can repeat this any number of times. Your league is kept up-to-date automatically.

There are three types of draft windows: Auction, Snake and Straight. The type of window that will be displayed when you click on Draft under Mode menu depends on the selection that you have made when you created your league. Note that you can change that selection anytime, although we do not recommend that you do that in the middle of a draft.

We recommend that you bring up the window to view the teams during the draft. Go to View menu item. For Auction, the window is Team Composition. It shows players for all the teams as

they are picked up, the salary left for each team and the number of players left to be drafted by each team.

Snake and Straight draft types use Teams by Round view.

If your league uses Roto scoring, open Roto Stats view. Roto Stats window will guide you through the draft by showing in real time strengths and weaknesses of your team. This window has tabs, each tab showing the standings of your team for one of the ten Roto categories as the draft progresses. Pay attention to the color of the fonts. If red for a Roto category, then you ought to pay attention to that specific category. On the draft window click on the header of the Draft list for the category showing weakness. The draft list will display the next available player who is projected to provide the best stats for that category.

Once you draft is done or, really at any time, you can export the team grid to Excel.

Post-Draft

There are three commands: to delete individual players from the teams, delete all players from all the teams in one motion and the third command lets you erase the Roto stats accumulated during the draft.

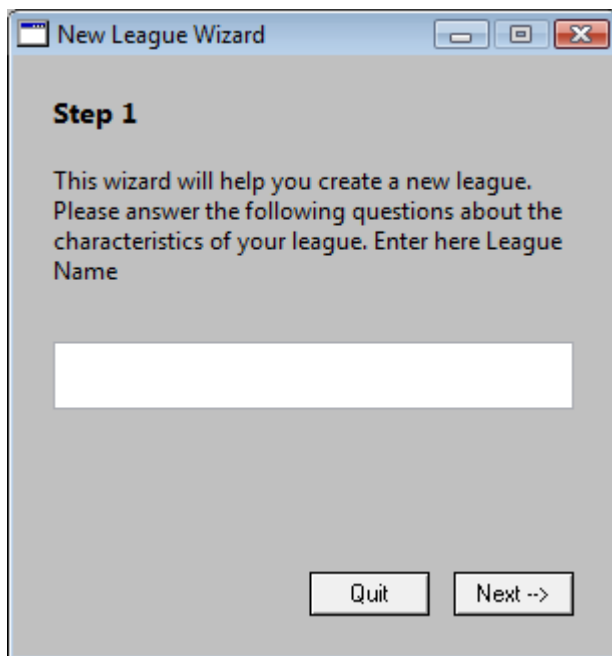

Now you are ready for the next season.

How to create a new league

Create League Wizard is located under File top menu. The key item to remember is that whatever you create can be easily modified with the Edit Wizard or deleted all together at a later time. A detailed description of available windows follows.

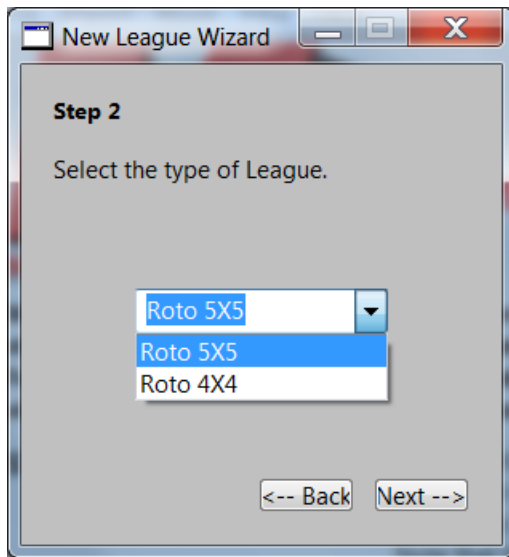

League name

This is the first window after you click on New League item under File top menu. Limitations are a maximum of 6 leagues and each league must have a unique name.

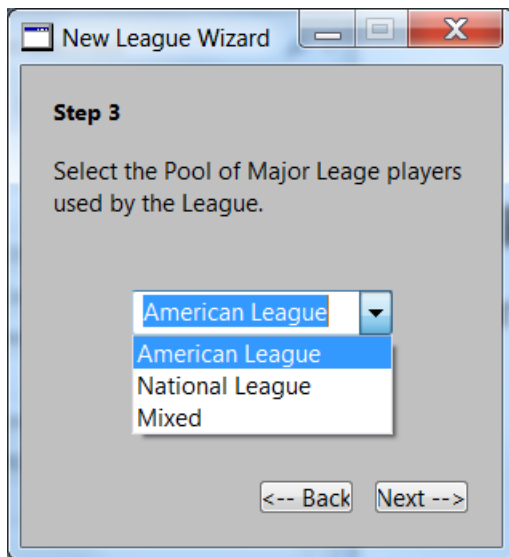

Type of league

Mastersball player projections have different values for 4X4 and 5X5 leagues. Player values that are shown in the Draft window will be adjusted in accordance to your league.

ML Player pool

Your draft list is prepared based on the input provided here:

Roster Set Up

Note that the default setting corresponds to a standard Roto league. But you can change it.

New League Wizard

Step 4
Select the roster configuration of the League.

CA	2	P	9
1B	1	SP	0
2B	1	RP	0
3B	1		
SS	1	<i>Totals</i> Batters: 14 Pitchers 9	
MI	1		
CI	1		
OF	5	Bench	5
DH	0		
UT	1		

<-- Back Next -->

Add teams

A minimum of two teams are required when initially a league is created. The order teams are entered determines the draft order but do not worry if you do not know the draft order yet. Teams may be re-ordered with the Edit wizard.

Step 7

Optional information about owners

Team: Team1 Owner:

email: Phone number:

address:

Save owner information for each team -->

Type of Draft

Time interval is defaulted to 0, meaning it will not be used. If you want to use it, enter a number in seconds, e.g. 90. Note that if you leave the interval at 0 and you start the timer anyway, a default of 90 seconds between picks will be used.

Step 8

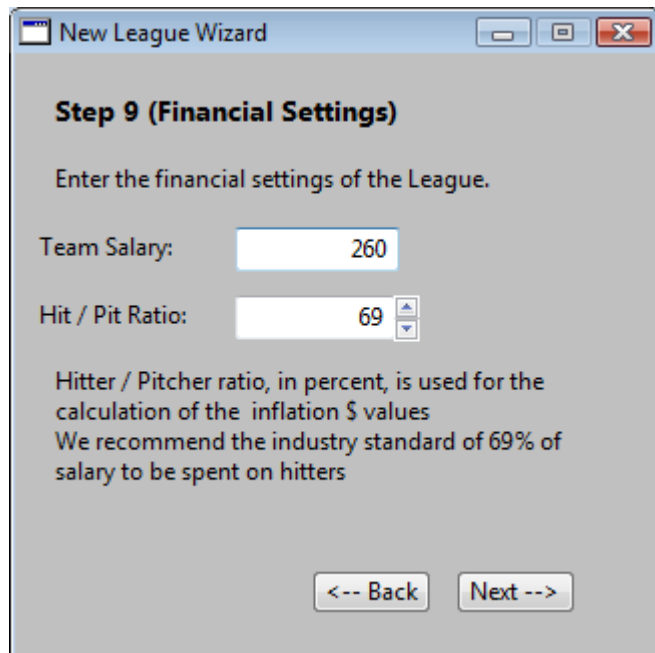

Select Auction or Snake type of Draft

Snake

Enter Time Interval between picks in seconds, 10 minutes max.
0 seconds is default, meaning that the timer will not be enforced

Financial Settings

Displayed only if Auction was selected:

Step 9 (Financial Settings)

Enter the financial settings of the League.

Team Salary:

Hit / Pit Ratio:

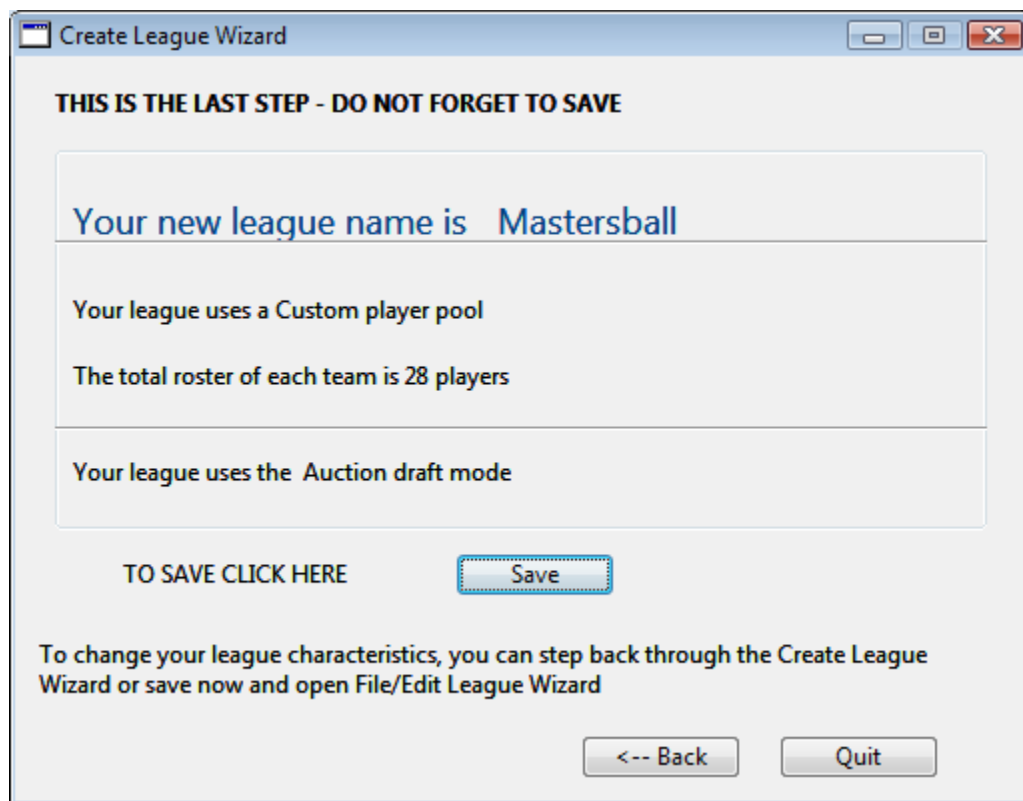

Hitter / Pitcher ratio, in percent, is used for the calculation of the inflation \$ values
We recommend the industry standard of 69% of salary to be spent on hitters

<-- Back Next -->

Note that reserve players do not count against the salary cap.

Save league

This is the last window of the Create Wizard. Note that at any time you can back-track all the way to the beginning and change anything before saving.

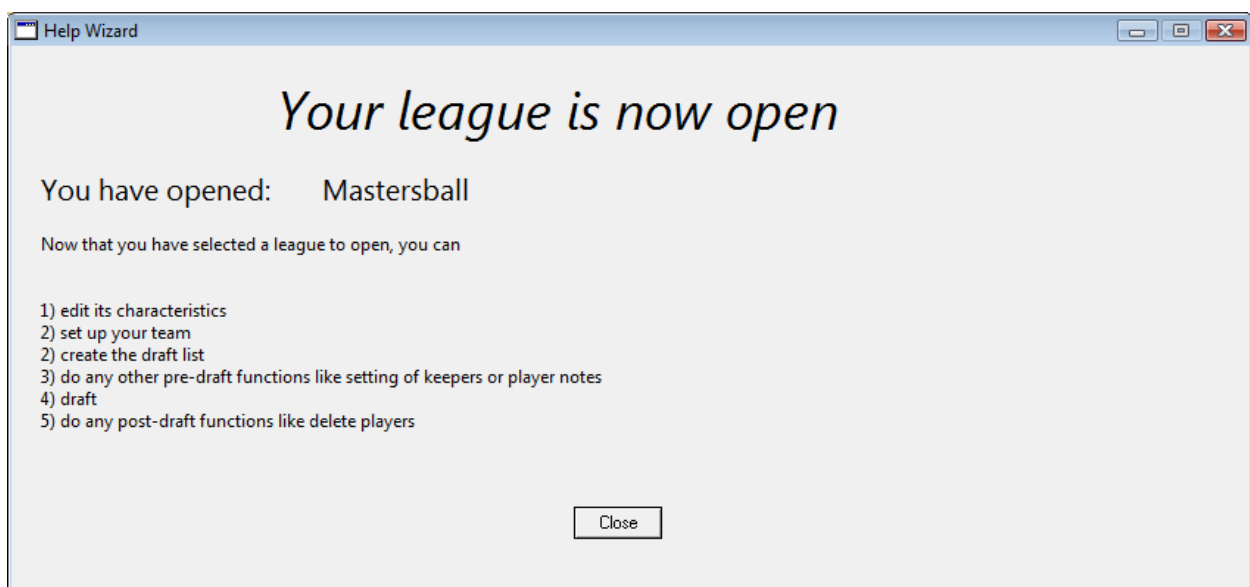

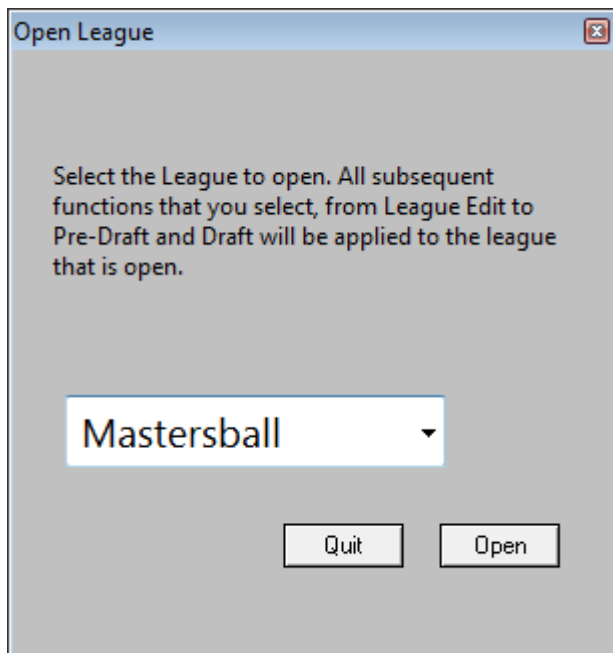

How to Open a league

Open League Wizard is under File top menu.

League Select

After creating a league and before doing anything else or when returning to MastersDraft you must open a league. It is a requirement of MastersDraft to open a league before acting on it. As soon as a league is opened, the following Help window is displayed.

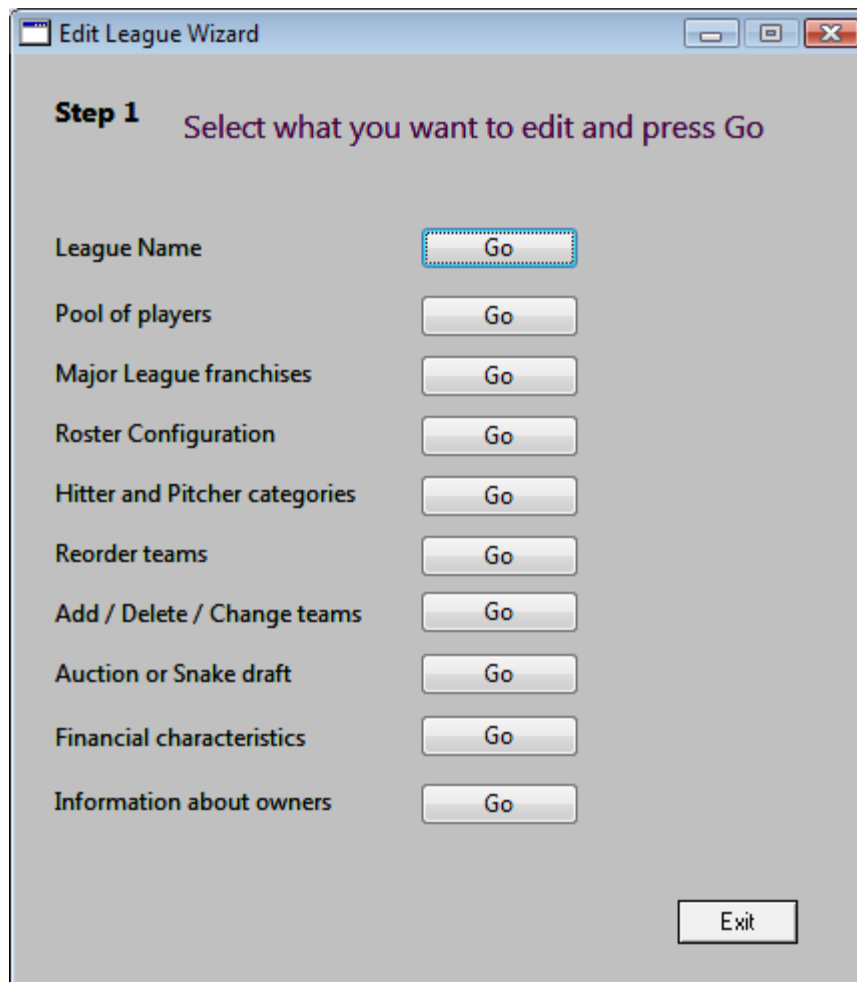

How to Edit a League

Edit League Wizard is under File top menu.

Edit select

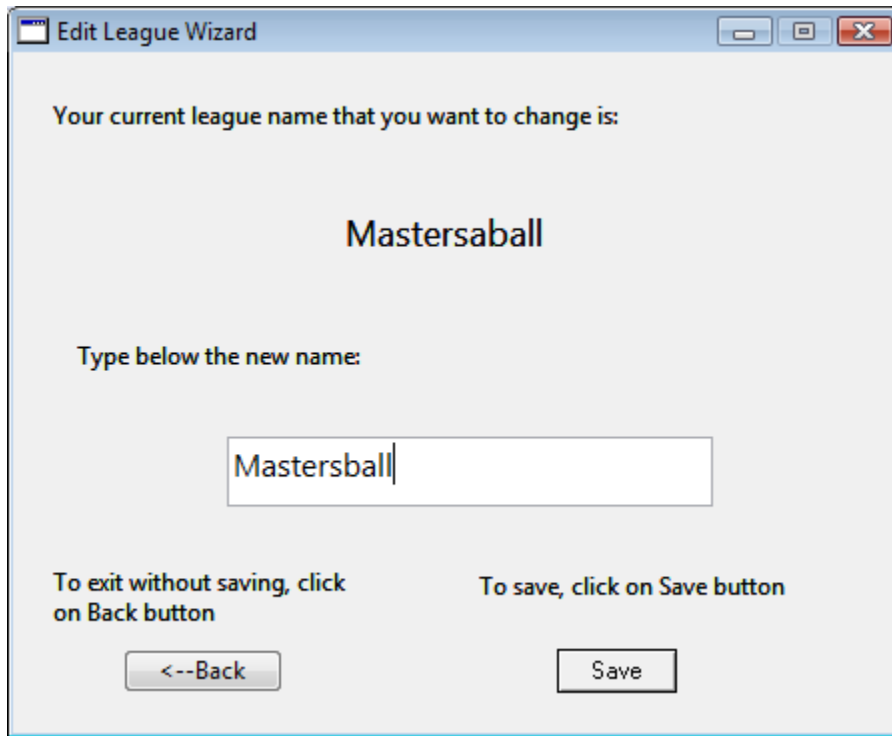

This is the top window of the Edit League Wizard. Most of the edit windows look the same as the ones for creating a new league.

All league characteristics can be changed any time with one limitation: once players are placed on one or more teams either via a draft or via keeper setting, the type of draft, that is, whether is auction or snake/straight draft cannot be modified. Also, and we think that this is a reasonable limitation, editing cannot be done during the draft. However, you can exit the draft, edit the league, for example, add a team and go back to the draft. You will see your newly added team. There are two editing limitations: roster composition and type of draft cannot be changed once the draft has begun.

How to change the name of a league

Any name is accepted, other than the name of an existing league. In the example here we are changing the misspelled Mastersaball to Mastersball.

The windows to change the Pool of players, Major League franchises, Roster configuration, Hitters and Pitcher categories, Type of draft, Financial Settings and owner Information are identical to the ones used to create a new league. The only difference is while during the league creation fields were left blank, here the fields are filled in with the data set up for your league. Use Edit League Wizard to check the league characteristics that you have originally set up.

How to reorder teams

This is an essential window because many leagues determine the draft order minutes before the draft and both the Snake and Straight Draft windows populate the team list automatically. Re-order your teams by drag & dropping teams in the right order. Save before exiting

[illegible]

How to add, delete and change team names

One note, both Delete and Add button save the action of team deletion and addition respectively. Exit saves team names and owner names if those were changed.

Edit League Wizard

To Add: Enter team owners (not required) and team names below and click on Add button
To Delete: Highlight the row to remove and click on Delete
To Modify owner or team names: Edit in-line on the table of names
Changes are saved on Exit

Order	Owners	Teams

How to import projections

Mastersball player projections released at the time of MastersDraft posting on the web site are pre-imported and available in the application. There is no need to import projections. You could import future projections released after you have downloaded the app or you may want to create values using CVRC tool and import them into the app.

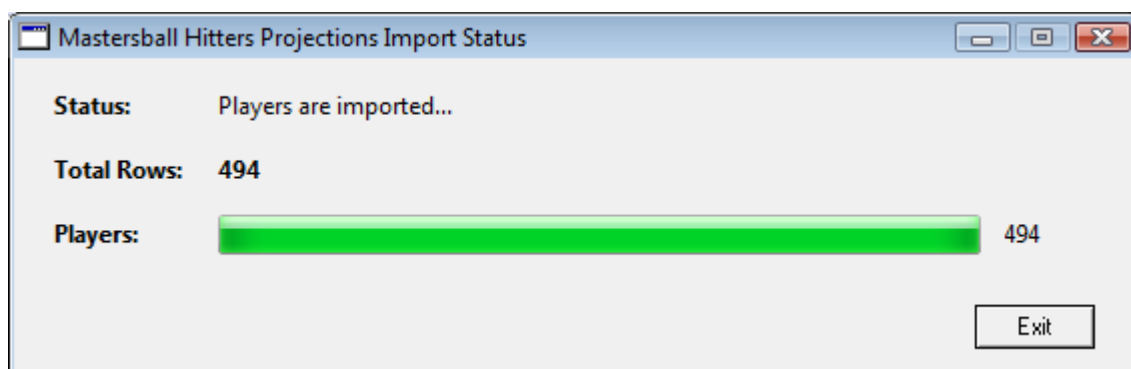

However, it may not be necessary to import the newest projections ever. Just download the newest app to a temporary folder and expand the zipped file. Then to be safe rename the existing mastersdraft.exe file and Mastersdraft lib folder by adding, say, old to the name. Place the newest .exe and lib folder in your mastersdraft area and you have the newest projections. The only thing that you must do is open the app and recreate the Draft list. Since a new version of the app is uploaded every time a new set of projections is released, keep your eye on the site and repeat the above.

To import new Mastersball projections, download the two projection files, one for hitters and one for pitchers, from the Platinum Download site.

Do not attempt to import the projections spreadsheet as downloaded from the web site.

Mastersball projections spreadsheet has four worksheets – see the bottom of the spreadsheet. Only one worksheet is importable. Most likely, the downloaded spreadsheet will not display the importable worksheet by default. To import you must open the downloaded spreadsheet, click on “hitters” worksheet to display it, copy its content to a separate spreadsheet and then import this newly created spreadsheet. Repeat for pitchers.

Import functions are under Import top menu. There are four import tools: Import Mastersball hitter projections, Import Mastersball pitcher projections, Import CVRC generated hitter projections and Import CVRC generated pitcher projections, see DraftSoftware tab. They use essentially the same window, see below.

The only difference is the window title, which reminds you who you are importing. This window pops up when you select the import item under the top Import menu. Next the standard Windows Browser pops up to allow you to navigate to where the spreadsheet to import is located on your computer. Once you select and open it, the import begins. When is completed, generally after a couple of minutes, the Exit button, see above, becomes visible and active.

To import projections created by CVRC, build your league characteristics and press CLICK FOR DRAFT SOFTWARE button. CVRC Excel macros will open the DraftSoftware tab. Highlight everything on this tab by clicking on the flag cell in the upper left corner at the intersection of row numbers and column letters. Then open a new Excel spreadsheet and copy & paste into this new spreadsheet. [This new spreadsheet is the one to import via Import CVRC Projections submenu item.](#)

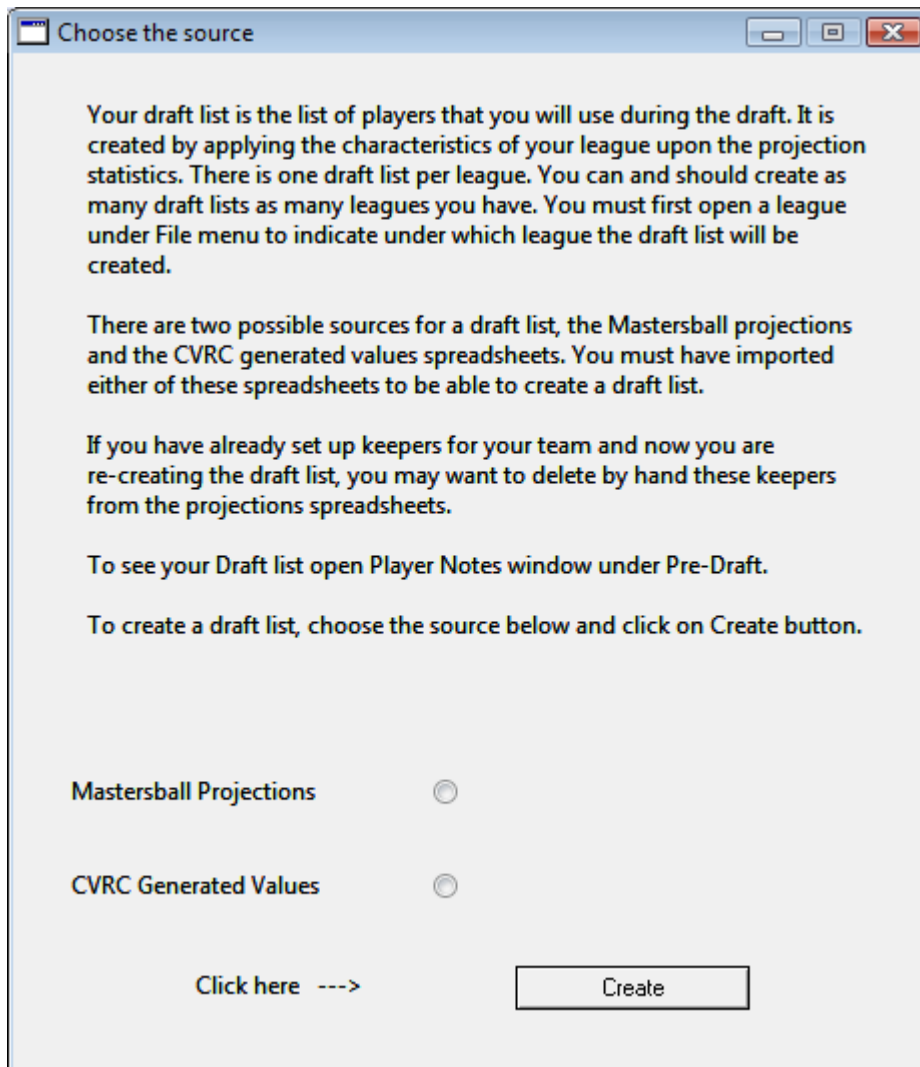

Note that during import you cannot have other Excel files open on your workstation.

How to create the draft list

Create draft List is located under Mode top menu item. You are now in the section of the application where you must first open a league. With a league open, create a draft list. You can do this as many times as you wish. If your league has keepers and you have them set up per team earlier, the keepers will not appear on the draft list.

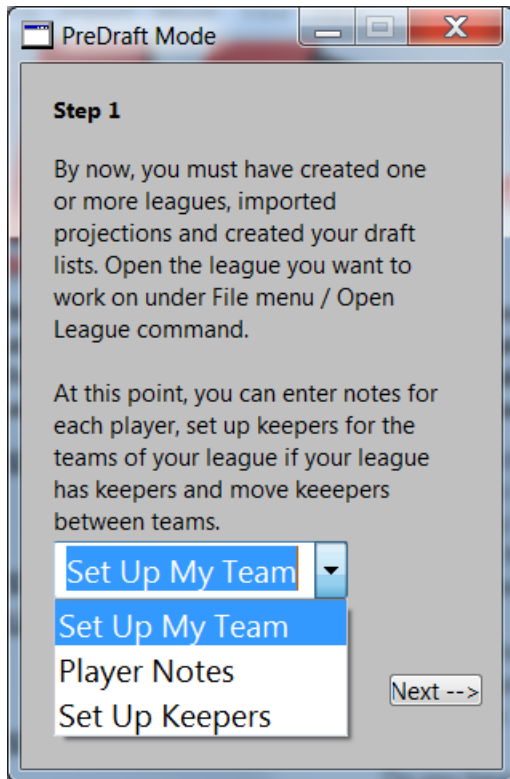

The Draft list window gives you a choice to base your list on either the CVRC generated player values or the Mastersball players projections. In either case, the list is built in accordance to the characteristics of your league.

We recommend that you recreate the draft list when you delete a team after the draft has begun.

What are the Pre-Draft Functions

The top Pre-Draft window gives you the choice to mark your team, enter notes per player, enter keepers and trade keepers between teams. Choose where you want to go and click on Next button.

How to set up your Team

And

How to set up your draft strategy

Tell MastersDraft which one is your team by highlighting it. Tell MastersDraft your strategy by setting the position in the standing for each category. You may choose to dump Saves one year. Next year you may dump Stolen Basis. By setting your strategy, MastersDraft will not change the color of the font on ROTO Stats window too soon.

Note that finishing third in every category has historically proven to give you a win. Try that. Set all categories to 3.

#	Team Name
1	Brain
2	Chris
3	Jason
4	Jesse
5	Lawr
6	Marc
7	Pasko
8	Perry
9	Rob
10	Todd

Highlight your team on the left.

Adjust the category standings according to your strategy. You may punt a category or two, for example you may not go after Saves. Draft software will follow your draft and provide you with a feedback in real time. Watch the progress on Roto Stats window. The fonts of the standings of your team will be green for those categories that meet your strategy. They will turn blue (yellow is not quite visible) if your team begins to loose ground. Red if your team is badly behind. Keep an eye on Roto Stats window and draft accordingly.

Hitter / HR	1	Pitcher / W	1
Hitter / BA	1	Pitcher / SV	1
Hitter / Runs	1	Pitcher / K	1
Hitter / RBI	1	Pitcher / ERA	1
Hitter / SB	1	Pitcher / WHIP	1

How to set up a staging area with player notes

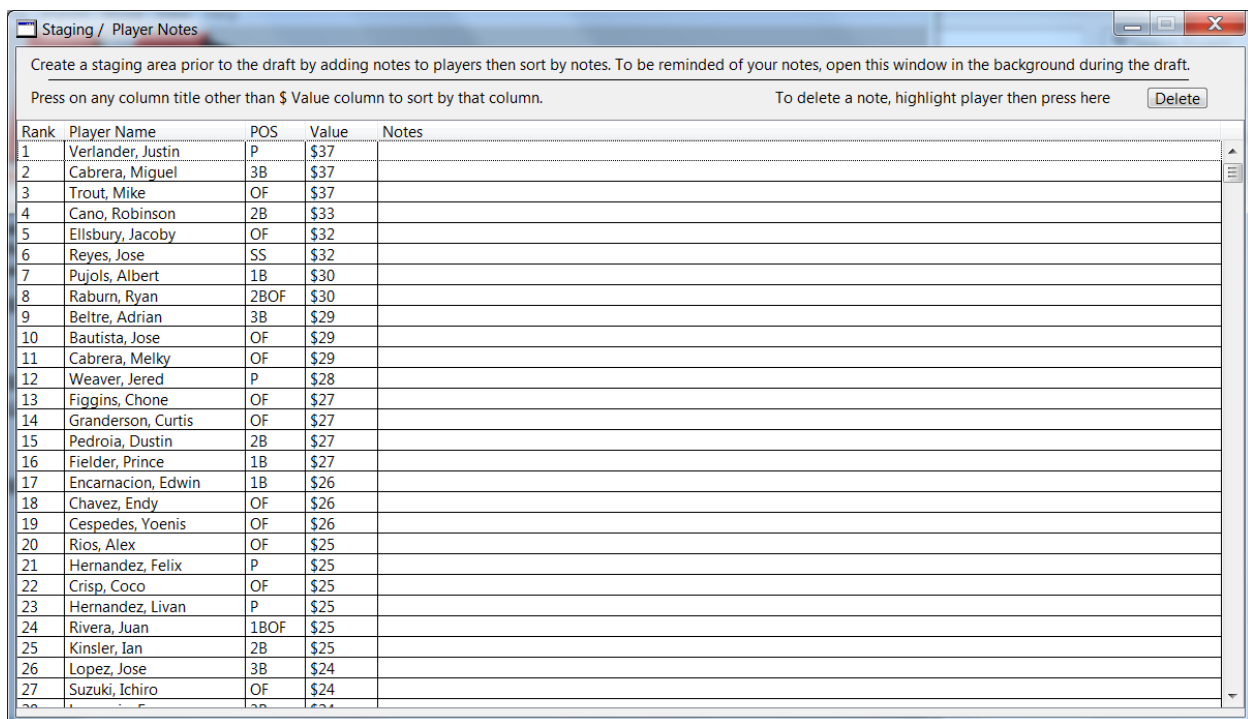

I do not know about you, but for me one of the most daunting tasks during a fast draft is to remember everything I read and learned the weeks and months leading to the draft. To alleviate this problem, Mastersdraft has a Staging / Player Notes window. Staging / Player Notes window is under View top menu item. The window, see below, is made simple for a reason. You do not want to have too much clutter during a draft. The window contains your draft list with columns for player names, their positions and dollar value and a blank column titled Notes. This column is editable and it allows you to enter your own personal notes for each player. Each note may have up to 80 characters. All the notes are saved once they are typed in. There is a Delete button to erase notes.

By clicking the mouse on the column header you can sort the list by that column (other than \$ Value column because that is that same as Rank column). Notes column is sorted in descending alphabetical order with letters on top and numbers below. We chose this sorting rule so that if you want to have a player on top of the list you can start his note with number 9 or letter Z. In other words, your players whose notes begin, for example, with numbers 9,8,7,6 and

5 will be your top five players in the staging queue, if you do not have any notes starting with letters.

Notes are items that you want to remember about a player. Another way to use this window is to enter a note for a player who may be buried down the list, but who you like and think as a hidden gem. After sorting by Notes, your gem will be right there on top of the list.

You can bring individual per-player notes up during the draft by double-clicking on the player name in Player List of the Draft window. However, if you have entered and created notes for players, we suggest that you bring the Staging / Player Notes view window up during the draft for quick reference and keep it in the background.

Create a staging area prior to the draft by adding notes to players then sort by notes. To be reminded of your notes, open this window in the background during the draft.

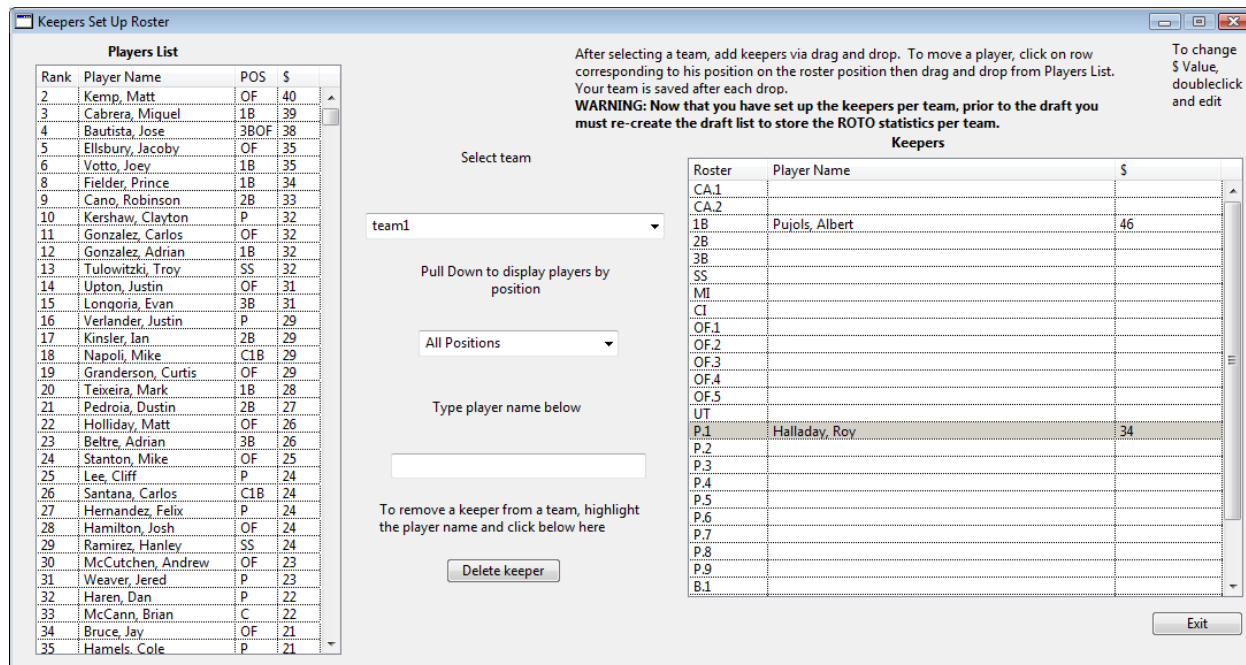

Press on any column title other than \$ Value column to sort by that column. To delete a note, highlight player then press here

Rank	Player Name	POS	Value	Notes

How to set up keepers

HINT: While MastersDraft offers specialized windows for setting up and trading keepers, an easy way to accomplish the same is to use the Draft window. This window allows undrafting. You can draft keepers before the real draft and you can undraft any player from a team and then place him on a different team when players are traded.

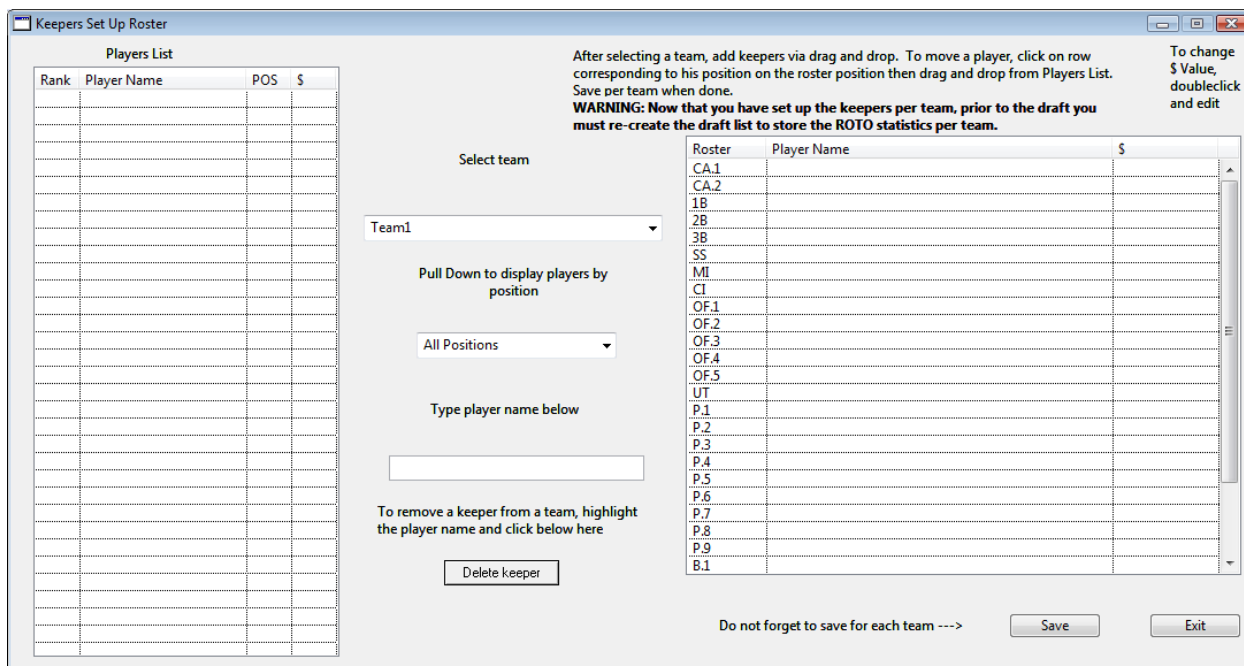

There are two different windows to set up keepers. If the currently open league has the Snake/Straight type of draft the following window is presented.

Window is automatically populated with the draft list and teams. While Draft software aims to be as flexible as possible one of few restrictions is encountered here: once keepers are entered for a league, you cannot change the draft type of the league.

Also, as the warning in bold on the window asks you, please, re-create the draft list once you are done entering keepers. That will allow ROTO Stats to include the projections of the keepers in its calculations.

The Keepers window for the Auction based leagues is slightly different. It contains the \$ value and allows it to change this \$ value per player. See the picture of the window below:

How to trade keepers

The question is, in other words, how to move players from one team to another team either after setting the keepers up and before the draft or before a new season.

There are two ways to do it. You can either use the Draft window or the Set Up Keepers window. Either way is very easy and intuitive.

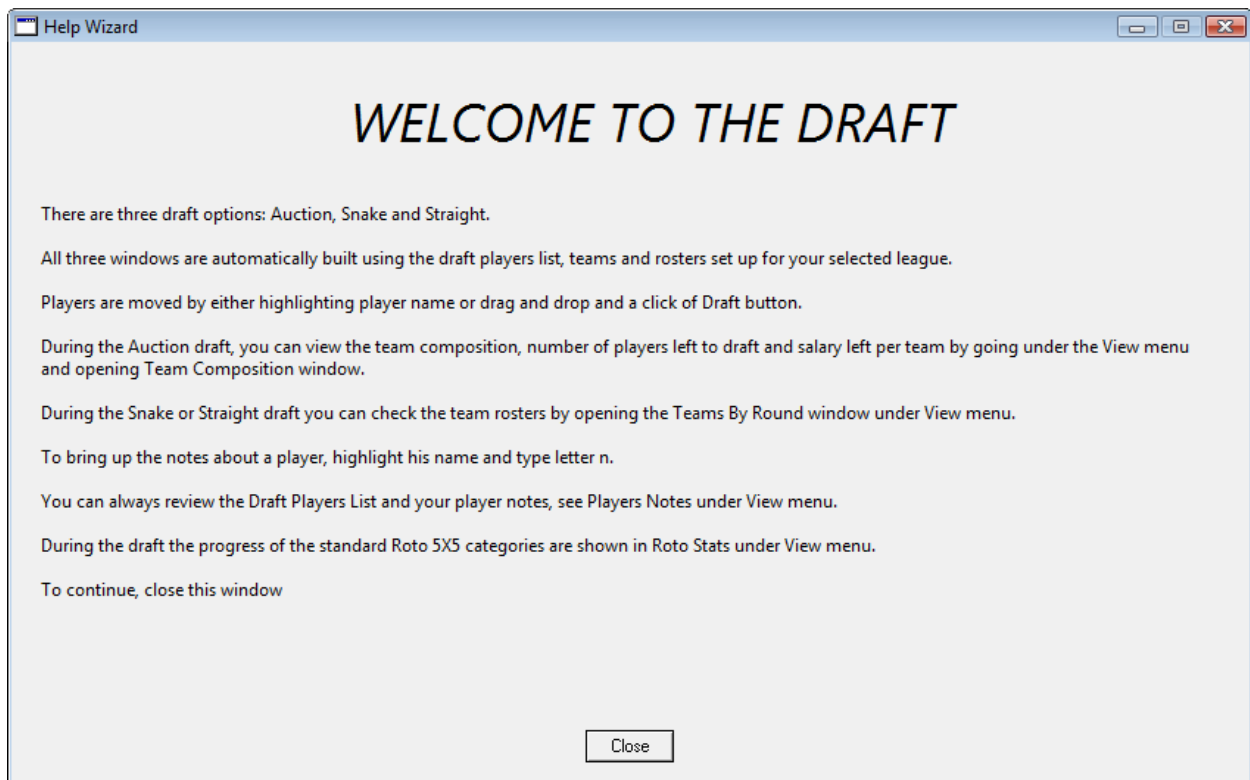

Using the Draft window way you should “undraft” players from teams, exit the window, re-create the Draft List, see Mode/Create Draft List and then draft the same players into their new teams.

With the Set Up Keepers window, select the team, delete player(s) from that team, exit, re-create the Draft List, go back into the Set Up Keepers and add the player(s) to their new team. You can do it in two motions. First delete all the players from all the teams, exit and re-create the draft list and re-open the window to add players back.

How to draft

There are two draft windows: one for Auction and another one for Snake/Straight type of draft. The window appropriate for your league will be displayed.

A help window pops up upon selecting draft under the Mode top menu.

Features of the Snake/Straight Draft window:

The following is displayed automatically: the draft list, number of rounds calculated based on the league's roster and number of teams. Teams are listed and displayed in either snake or straight order.

For visual help, pitchers on the draft list are shown on a light green background.

Timer starts when the first player is selected. Timer can be stopped, suspended and restarted.

How to draft

To pick a player, highlight him and click on Draft button. Player will automatically be placed in the next available slot.

Drafting Out of Order

If you want to place a player in a slot other than the next slot use Out Of Order draft function. Type in the pick number or use the up and down arrows to select the pick number and then click on Out of Order Draft.

How to undraft

Highlight the player you wish to remove and click on Undraft. If you undrafted the last drafted player, the next drafted player will end up in this newly emptied spot. However, if you undraft a player from the middle of the list of previously drafted players, you must use the Out of Order Draft function to replace the player in that empty spot.

How to sort by roto category

You can sort the players by position; see radio buttons in the middle of the window. You can sort the draft list by their roto projected stats by clicking on the title of the column. Do you want to sort players alphabetically? Type letters in the input field below the caption "To select player, type name below". The moment a letter is typed all players whose last name starts with that letter are displayed in the projected rank order.

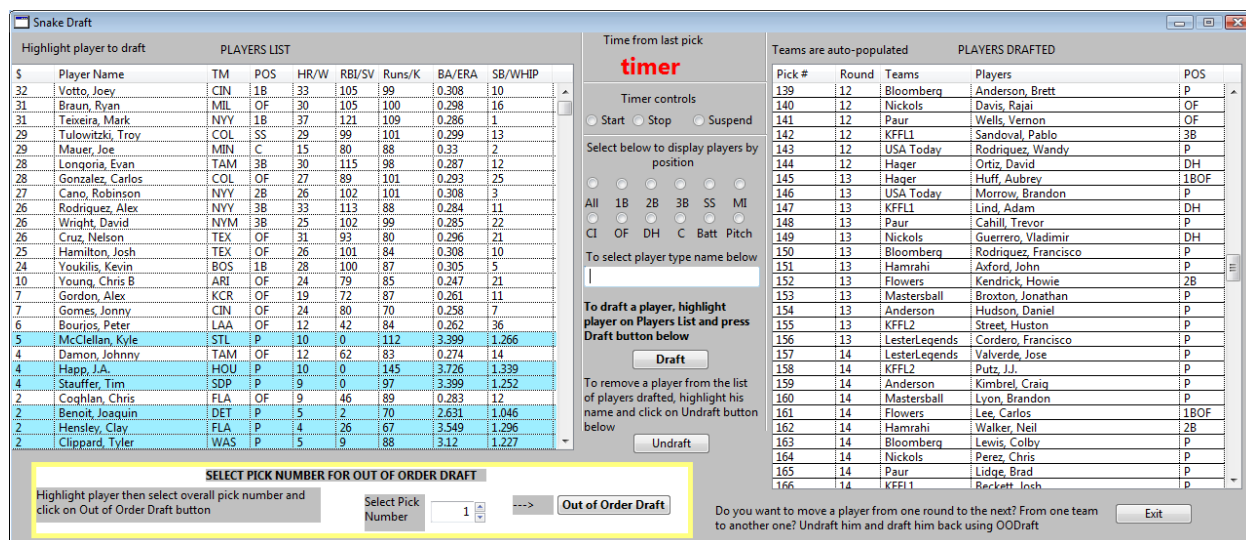

The 5 columns displaying the Roto stats are sort able. Click on the header and the players will be displayed in accordance not of the \$ value but of the Roto stats you selected. Now, in order to make the window manageable in size, the pitcher and batter stats are combined on the same column.

HINT: We recommend that you first check the radio button to show either all batters or all pitchers before sorting by column. Otherwise it can get confusing. In addition the column with SB/WHIP is sorted in descending order, that is, from the highest to the lowest for SB and in ascending order for WHIP. Columns are either ascending or descending depending on whether you have selected batters or pitchers.

All columns have the ability to be sorted by clicking on the column header.

How to get player notes

Double-click a player name in Player List to display any notes that you may have entered earlier for that player.

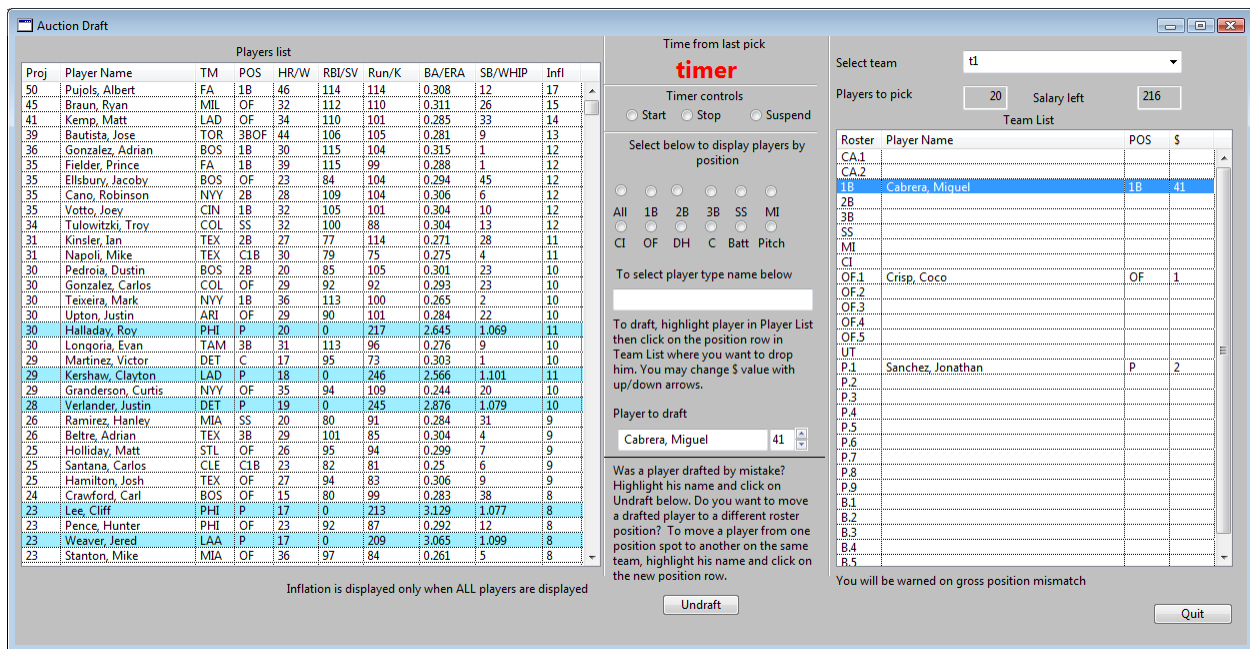

Features of the Auction Draft window

The differences between the two windows are small. Auction window has the \$ values. Roster instead of rounds is automatically displayed. To display a team, select the teams pull down, see upper right corner. There is no Out Of Order draft function. Below the team name there are two displays: one shows the number of players left to draft, the other \$ amount still available.

How to draft

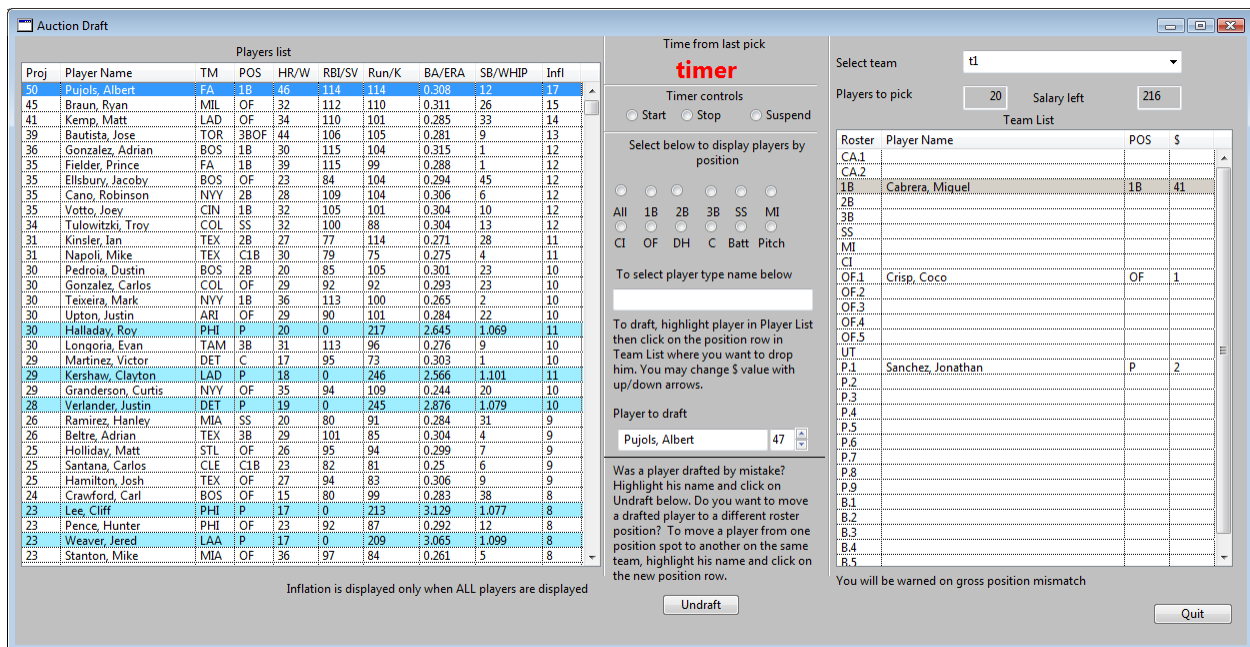

To draft a player, remember first to select the team that is drafting. Highlight player name in the Player List. Player list is located on the left of the window and shows undrafted players. As soon as a player is highlighted, his name and value appears in the field located in the middle of the window. See the picture on the next page.

The Player's inflated values are calculated every time a player is drafted. Hitters and pitchers have different variables that are used for the calculation.

How to change player \$ value

Use up and down arrows to change the \$ value, if necessary. In the example below, Pujols was highlighted. His projected value is \$50, but his bid was \$47. At this point simply click on the spot where you want to drop him.

Note that \$ values can also be edited in-line on the Team List itself.

How to move players

If you have clicked on a wrong roster spot, simply click on the correct one. The player will be moved. His name and value remain active until you highlight another player on Player List. If you want to move a player from one roster position to another one on the same team, highlight the player name and then click on the new open spot. The player will be moved. However, if you draft a player by mistake or place him on the wrong team by mistake, you must use the Undraft function.

Players and Salary displays

Two numbers are displayed and automatically calculated for you: the number of players remaining to be drafted and the remaining salary. After each player drafted, these number are calculated for you. For example, if the roster has 28 players and the total salary is \$260, see the above picture as an example, after drafting Pujols, number of remaining players is 27 and the remaining salary is \$217. This number will change to red fonts if it becomes negative.

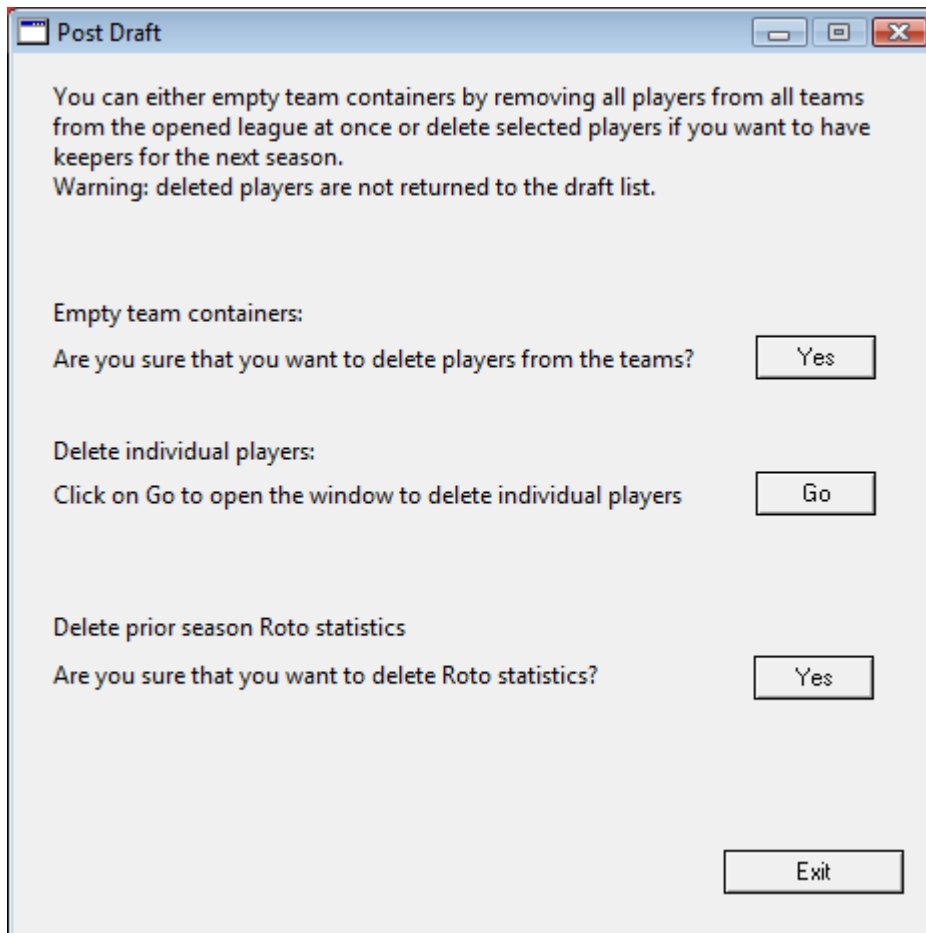

Bench players do not count against the salary cap.

Although the window strives for flexibility and it will let you do whatever you want, it has a minor warning if a pitcher is placed in a hitter roster position or if a hitter is placed in a pitcher position.

Inflation column

Note that inflation is calculated and displayed only when all players are displayed. That is, it is not displayed when players by position are displayed.

What to do Post-draft

You have three choices: to delete all players from all the teams, to individually delete players or to zero the ROTO stats. Please, do that after the season.

If you have selected to delete individual players, you are presented with a two similar windows, one for the Auction league and another one for the Snake/Straight draft.

The Auction type window:

Post Draft - Delete Individual Players

After selecting a team, highlight player name and click on Delete button. Click on Save before moving on to a different team.

Select team

What is MaxBid

It is the maximum bid that you have available to bid on a single player. The following consideration is used for the calculation of MaxBid: that all other players will cost \$1 and that bench players are included in the bidding.

View Teams by Round during snake and straight draft

The window below appears when Snake/Straight draft is selected.

Both windows are View only, that is, they cannot be edited.

Snake Draft

hp

Yahoo! Search

ROTO Stats window which was explained and discussed earlier is also under the View top menu.

How to export to Excel

MastersDraft allows exporting the team grid to an Excel file. The push-button to export to Excel is located in the upper right corner of the two views, Teams By Composition and Teams By Round. These two views pop up automatically behind the Draft windows. See the picture below for the location of the Export to Excel push-button.

Teams by Round

Teams 1-12Teams 13-24

Team Grid

How to view Owner Data

This window is under top menu View. You must first open a league to view it. Select team to see owner information.

View Owner Data

Information about owners

Select team to see owner data

Team: Owner:

email:

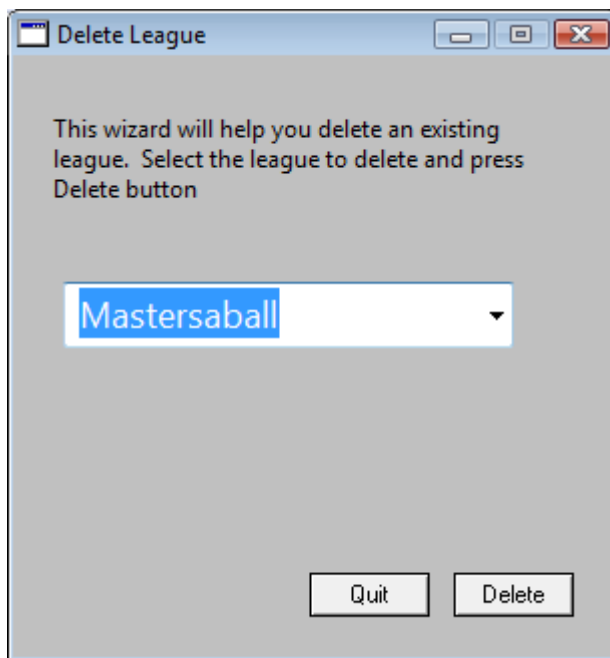

Phone number:

address:

Exit

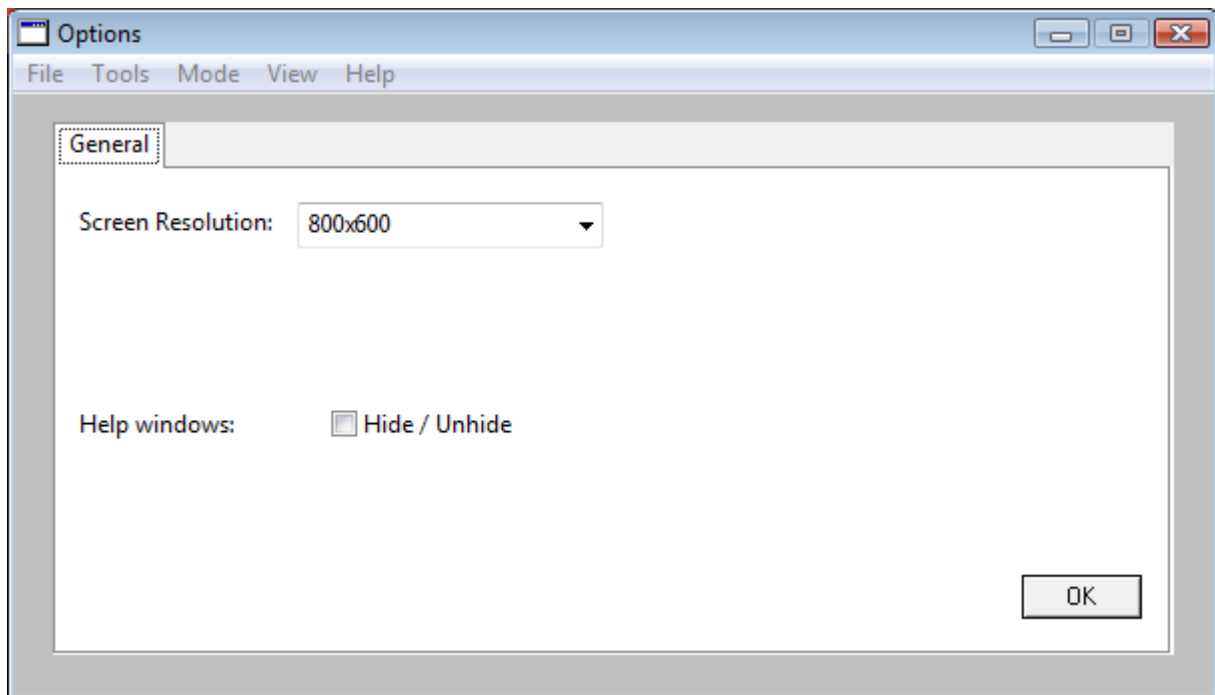

How to delete a league

Delete League under is File menu. This is pretty much a self-explanatory window. The typo in the name is intentional. You will be asked to confirm the deletion. Once deleted, all league info is gone.

What are the Options

Option window is under File menu. It has two functions: to select resolution and whether you want or not to display Help pop-ups upon opening a league and starting a draft.

Appendix: Windows 8 FAQ

FAQ #1: Where to place files downloaded from Mastersball.com?

On Windows 8 Metro start screen, click on the icon labeled Desktop located in the lower left corner. Desktop in its old format will appear. Open File Explorer (see Folder icon pinned on the taskbar). Expand folder Windows8_OS under Computer. Expand Users. You will see a folder having the name of the user who you created when you first brought the system up. Expand it then right click on it and then left click on New Folder. A new folder will be created. Rename it and give it the name of Mastersball. Keep all the files downloaded from www.mastersball.com here.

[By following the above steps you will avoid security problems experienced with Windows 7]

FAQ #2: How to add www.mastersball.com site to IE Favorites?

Start Internet Explorer on the Metro start screen. Type www.mastersball.com at the HTTP:// address in the lower portion of the screen. When the web site appears click on the pushpin command icon.

To display the favorites next time you bring IE up, right click on a blank area in the upper portion of the screen. Open tabs will appear. If Mastersball is not one of them, click on the + command icon and your favorites will appear in the lower area of the screen. Click to start icon labeled Mastersball.

FAQ #3: Where are my files that were downloaded from Mastersball?

Follow the instructions given above for FAQ#1 up to the expansion of the folder having your name (or name of the user you created at start up). You will find folder Downloads. Files are in this folder. Open it and cut/paste files downloaded from www.mastersball.com to the newly created folder Mastersball.

FAQ #4: How do I create top icons for applications downloaded from Mastersball?

A top icon is an icon located on the Start screen. Via the File Explorer highlight the application and right click. Left click to Pin to Start. On return to the Metro start screen, scroll to the right to find the new icon.

FAQ #5: What do I do with the security warning?

When you run an application for the first time, you may receive a warning splashed across the screen: *Windows Protected your PC. Windows SmartScreen prevented an application from starting. Running this app might put your PC at risk.* Click on More Info [do not click on OK], followed by Run anyway. There are no concerns. All Mastersball downloads are virus free.
